Predictive Services Discussion: An upper level low pressure system will move into the Northwest U.S. today with the preceding cold front bringing breezy to windy conditions across portions of the west. Widely scattered showers and thunderstorms will also develop from northern California through the northern Great Basin as this system makes its way inland. Much cooler conditions will result today, with onshore winds along the Pacific coastline, but breezy ridge top winds. Moist southwest flow will provide showers and thunderstorms to the central Rockies today as well. East of the Rockies, a warming trend will begin, with windy conditions anticipated for the central Plains ahead of a strong cold front. Rainfall will be limited to New England and the Gulf coastal region.

HAZARD TREE – NO WORK ZONES (NWZ)

Felling Safety Category

Knowing when the exact time a given hazard tree (or compromised section) will fail is an extremely difficult, and is, in many cases, an unpredictable task. Given this fact, we need to manage firefighters' exposure to these hazards by creating a safe work area or NWZ. The size and extent of the NWZ must be determined by onsite conditions, such as terrain, lean, active fire in the tree and adjoining trees.

When an identified hazardous tree cannot be felled, then perform an assessment of which areas have too high a risk, and post a lookout to warn the personnel to stay clear of these areas while working in adjacent areas. If hazard still exists before leaving the area, flag the NWZ so that personnel entering the area will be able to recognize the hazard. Use the following failure zone illustrations as examples to help manage firefighter exposure to these identified hazards. Also remember to include the possibility of the "Domino Effect" to surrounding trees.

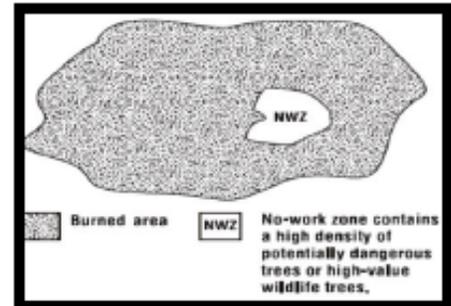

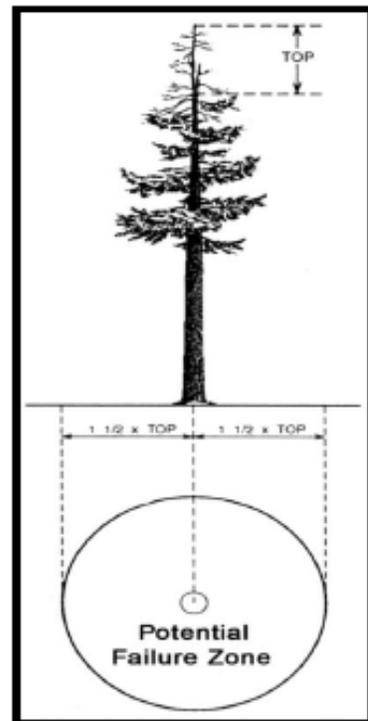

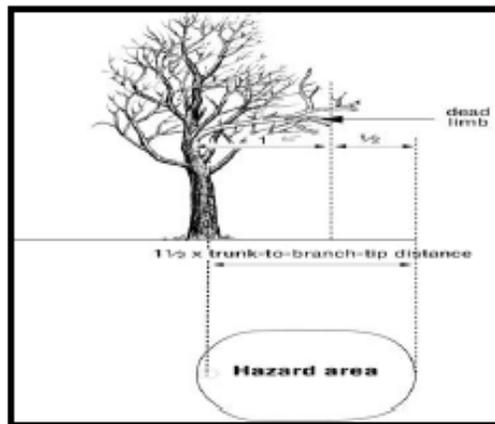

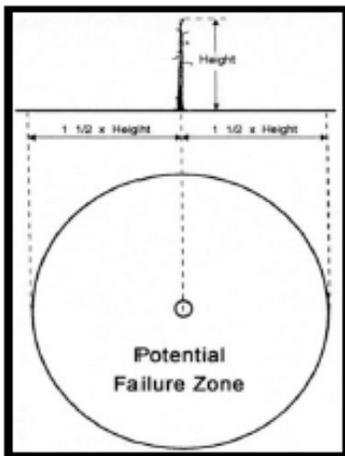

Figure 1 – $1 \frac{1}{2} \times$ Height of snag Figure 2 – $1 \frac{1}{2} \times$ trunk-to-branch-tip distance Figure 3 - $1 \frac{1}{2} \times$ length of dead top.
