Fuels and Fire Behavior Advisory  
Southwest and Central Interior Alaska  
*Valid: June 12 – June 25, 2022*

**Subject:** Exceptional landscape flammability and widespread ongoing large fire growth.

**Discussion:** The Buildup Index (BUI) is the best indicator of seasonal severity and overall flammability of fuels in Alaska. It represents deeper drying in the duff layers and greater fuel availability. Large fire growth occurs from mid-June to mid-July surrounding the summer solstice when long days and rapid drying can produce elevated BUI levels. Southwest Alaska normally experiences shorter periods of high flammability as they are prone to intermittent rain due to marine influences. Beginning in the middle of May, southwest Alaska has experienced continued hot, dry, and windy conditions, drying out fuels, retarding green-up and producing significant large fire growth. Many fires in southwest Alaska have experienced exceptionally large fire growth over the last week, which is unusual for the area.

**Difference from normal conditions:** The attached graph shows the current 2022 BUI trend for the Interior of Alaska compared to other busy fire seasons. 2022 has been above average BUI since May 31, and higher than 2015 levels since June 6. Southwest Alaska has already experienced abnormally large fire growth for this time of year. Multiple days of wetting rain adding up to more than one inch will be needed for lasting relief.

**Concerns to Firefighters and the Public:**
- Spruce stands are extremely flammable, will ignite readily, exhibit rates of spread more than one mile per hour, torch, and spot prolifically up to ¼ mile or more, and exhibit intense crown fire behavior.
- Temperatures above 80 degrees and RH below 30% are important thresholds for rapid spread and crown fire behavior.
- Green fuels are stressed and encouraging spread into riparian areas and less flammable hardwood forests.

**Mitigation Measures:**
- Ensure that you can recognize hazardous fuel types including tundra that is exceptionally dry.
- Understand the triggers and thresholds for problem fire behavior.
- Monitor forecasts and indices to anticipate areas of increased flammability and extreme fire behavior.
- Maintain clear communications when working around active fires.

**Area of Concern:** Southwest Alaska, and the central Interior. Conditions over the next few weeks may spread to include a wider portion of Alaska.

**Issued By:** Alaska Interagency Coordination Center Predictive Services
